Ethics application

Guidance

The applicant confirms to have read and understand the the ethical principles as outlined in the Code of Ethics for researcher in the social and behavioural sciences.

The applicant confirmed adhering to the ethical guidelines of the Ethical Code of Conduct of the NIP or NVO.

The applicant confirmed that the proposed research plans do not fall within the scope of the Medical and Scientific Research on Humans Act (WMO).

Explain why your proposed research plan does not fall within the scope of the WMO.

Research is subject to the WMO if the following criteria are met: 1) It concerns medical scientific research and 2) participants are subject to procedures or are required to follow rules of behaviour. Please refer to these criteria in your answer.

The current project does not concern medical scientific research and does not require participants to follow procedures outside of what is mandated by law and does not require participants to follow rules of behaviour.

Prior ethical review

Has this project already been reviewed by another Ethics Review Committee?

No

Research project details**Project title (short)**

A Safe Bet: design and pilot evaluation of a player-tailored online responsible gambling promotion framework.

At which location(s) will the study be performed?

Quantitative study: Online investigation; data collected from participants in both the Netherlands and the U.K.

Qualitative study: online video conference/call recorded interviews with both Dutch and British participants.

Which is/are the main question(s) of the study?

To evaluate a proof of concept (POC), novel, preventative intervention framework for online responsible gambling (RG). The current project has two primary aims:

1. To assess the feasibility and user acceptance of the RG framework:

- a) To what extent do players engage with the studies recommended (i.e., implemented) RG tools?
 - b) Are there differences in player engagement among different types of RG tools?
 - c) Are the RG tools perceived positively and are regarded as useful?
2. To investigate the potential impact of our novel RG framework on the patterns of online gambling behaviors:
- a) Does a player's risk level assignment (i.e., risk status) change or remain equal after exposure to tailored RG tools?

Describe the method of the study

Give a detailed description of the design and variables, materials, and procedures so that it will be clear what a participant will have to do and will experience during the experiment. Name and describe (briefly) all independent variables, tasks, procedures, machinery, etc. and time investment for participants.

Design and variables (dependent and independent)

The goal of the project is to implement and examine the use of targeted RG tools dynamically recommended to players and tailored to their individual level of risk. By combining a validated online gambling risk assessment algorithm using behavioural tracking data with a newly developed evidence- and theory-based library of micro-interventions and digital nudges (i.e., RG tools), we hope to scaffold a player-tailored RG promotion model.

A proof-of-principle (POC) version of the RG framework will be developed and piloted in the UK and NL, deploying RG interventions mandated by both Dutch and British gambling regulations (with some differences) and a selection of RG tools holding scientific promise. The POC RG framework will be released to all customers across two gambling operators simultaneously (namely Holland Casino (NL) and VF2011 Limited, U.K., subsidiary of PlayTech Plc, including Sun Bingo and Sun Vegas platforms). The POC evaluation study will adopt a naturalistic mixed-methods approach via a sequential QUAN-qual study design.

Quantitative data collection:

Quasi-experimental study lasting over a period of 6 months (i.e., two cycles of 90-day evaluation periods). All players will dynamically receive sets of RG tools tailored to their current level of risk over a period of 6 months, with their level of gambling risk assessed daily by the existing gambling risk assessment algorithm already in place on the collaborating gambling operators websites. Feasibility, user acceptance and potential impact of the RG framework are operationalized into the following outcomes:

1. Player engagement with RG tools will evaluate a user's adoption, interaction with and reaction to RG tools. Engagement metrics are based on log data parameters defined in the POC and dependent on the type and contents of the selected RG tools (e.g., message, call to action, educational content). The range of web analytics will include aggregated usage parameters (i.e., frequency and time spent interacting with an RG tool) and aggregated response rate (i.e., rate of completion of a task when an RG tool includes an immediate call to action) for each RG tool included in the POC. An additional metric of general adoption of the POC system as a whole will be derived from these outcomes, i.e., the percentage of players that interact with any RG tool at all over the study period, which can be useful to compare previous benchmarks of RG tool use within the operator and in the literature.

2. User satisfaction with RG tools will be assessed via short intercept user satisfaction surveys released live on the operator's website during the study period. These brief surveys will assess the following dimensions of satisfaction, intrusiveness, usability, and utility perception of a given RG tool deployed to the player.

3. Individual risk trajectories over the study period will be examined to evaluate fluctuations in gambling risk (as assessed daily by the gambling risk assessment algorithm), in relation to the individual number of active gambling days on the operator site and the series of RG tool deployed over the study period. A trajectory of risk level assignments for each individual will become available, with each data point corresponding to the gambling risk level assigned on the day a new RG tool set was deployed and used as the outcome for the previous set of RG tools. The gambling risk level on day 1 and day 180 will be additionally used to evaluate the discrete change in risk level at the group level between the start and end of the study.

NB: the unique impact of RG tools (i.e., tool efficacy) will not be assessed at this stage, as the focus of the POC evaluation looks at the system of RG tools acting in concert rather than on individual RG measures alone. Further, given the naturalistic setting and the constraints deriving from online gambling regulations, a controlled design comparing the POC version to the RG tools currently implemented by operators (i.e., treatment as usual) was considered not feasible.

Qualitative data collection

At the conclusion of the quantitative study period semi-structured interviews will be conducted with a subset of participants selected from the quantitative study sample. Participants will be interviewed regarding their experience with the RG tools received. The main goal is to gather more nuanced feedback and a first-person account of the experience with and perceived quality of the RG tools. Interviews will follow a semi-structured script on the following topics: type of RG tools received and interacted with, most and least preferred tools, perceived helpfulness, utility, and timing, quality of information provided and modality, interventions' interference with play.

Materials, Stimuli, and/or Apparatus

1. Gambling operator site: behavioral tracking data of gambling activity (i.e., deposit, gameplay, limit activity), web analytics related to RG tool usage and gambler risk level will be automatically collected through the operator website.

2. RG tools: the RG framework is comprised of multi-modal RG micro-interventions and digital nudges embedded within the gambling operators' online interface (i.e., functionalities, web features). RG tool functions (i.e., how a player interacts with any given RG tool) include (but are not limited to) call-to-action messages, psycho/educational content, and personalised feedback on gambling behavior, displayed via pop-up messages, alteration of web / game features, and user dashboards. RG tool targets define the proximal outcome to be manipulated by the micro-intervention or digital nudge; for example, functions that require a call to action via placing a limit on monetary activities are deployed with the target of reducing riskier spending behaviours. Finally, RG tools are tailored by the level of gambling risk (i.e., low, medium, high).

3. User satisfaction surveys: short intercept user satisfaction surveys released live on the operator's website during the study period. Surveys will be developed ad-hoc and will include a max of 1 question rated on a five-point Likert scale [1-5; strongly agree to strongly disagree], with an additional response option indicating "I did not use this tool". Surveys will be distributed over the study period

after implementing a new set of RG tools using a quasi-random deployment approach. All players will receive a survey dependent on the number of times a new set of RG tools are deployed to the user to minimize burden with a minimum of 2 surveys over the whole study period. The RG tool focus of the survey will be pseudo-randomly allocated, balancing out the quota of completed surveys for each deployed tool across all participants.

4. Qualitative interviews: interviews will be conducted over videoconferencing software (i.e., Zoom). The interview transcripts will be analysed using thematic analysis by two independent coders using Atlas.ti.

Procedure

Quantitative study

The POC framework will be released on two gambling operator sites simultaneously (UK and NL).

The POC version will be released to customers of Holland Casino (NL) and VF2011 Limited (U.K., subsidiary of PlayTech Plc including Sun Bingo and Sun Vegas platforms). Players will be included as research participants when fulfilling the following criteria: 18+ and satisfying all legal requirements to engage in online gambling on the operator site and having a minimum of 15 active gambling days (as required for the risk assessment algorithm to accurately assess risk), and the consent to share their data for scientific research.

Both operators are mandated by law to implement and evaluate RG measures, hence gamblers cannot refuse to receive RG measures on their accounts. The inclusion procedure will notify all players (at the next player login) of an update to the player interface designed to improve customer experience and protection (i.e., a study brief). No explicit consent will be asked concerning receiving the POC framework (interface); however, all players are given a choice to opt out at any time and without reason from sharing their anonymized data for scientific research purposes by adjusting their privacy settings, in accordance with European data privacy regulation (GDPR, 2018). Participants will not receive any type of incentive in joining the quantitative study.

Both operators are responsible for participant inclusion in the study period and participants monitoring of gambling behavior is carried out by default in accordance with national regulation requirements through the same risk assessment system operating on both gambling platforms. Aligned to the naturalistic design, no research-led interactions with players will occur. At the conclusion of the study period, data will be extracted and anonymized by the operators before being transferred to the researchers for analysis.

Qualitative study

Participants will be recruited from the main sample via purposive sampling. Selected players will be invited by the operator to participate via email, which will briefly explain the main goal of the interview and the terms of participation (i.e., participation is voluntary and can be stopped at any moment, no further contact attempts will be made when they decide not to participate). If any participants decline the invitation, recruitment will continue until the desired sample size is reached. When players indicate they are interested in participating, they will be redirected to an online form where they are asked to give their informed consent and select a preferred date and time for the interview to take place. Interviews will follow a semi-structured script on the following topics: type of RG tools received and interacted with, most and least preferred tools, perceived helpfulness, utility, and timing, quality of the information provided and modality, and interventions' interference with play. The interviews will

take place via videoconferencing (i.e., Zoom) and will be audio recorded for later anonymized verbatim transcription. The interviews will be conducted by the PhD candidate with the support of one student assistant and will take approximately 30 minutes to complete.

If applicable, upload materials to illustrate the method of the study.

Start date of the project

03 Oct 2022

Are you asking for ethical approval regarding a collaborative project?

Yes

Are you asking for ethical approval for only part of the project?

Yes

Please specify the parts you want to receive approval for.

This project is Phase I of a larger research collaboration between academia and the gambling industry lasting 4-years. Phase II will involve a full effectiveness evaluation study and will be submitted to the ERB in a separate evaluation in due time.

Please upload any relevant project details, particularly full documentation for collaborative projects, including ethical approval for the full project if available.

Type of research

Will you obtain primary data directly from individuals?

Yes

Please specify the method(s) you will be using.

Quantitative: behavioural tracking data, user satisfaction surveys, web analytics for RG engagement outcomes, gambling risk assessment (live Machine Learning classification algorithm), semi-structured interviews.

Will you obtain publicly available data?

No

Will you obtain existing datasets?

No

Please specify which type of institute (e.g., research institute, NGO, company etc.) is providing this dataset and in which country this institute is located.

Industry partner; company.

Will you be using (an) anonymised dataset(s)?

Yes

Have you obtained permission to use this/these dataset(s)?

Yes

Does your research involve existing data or secondary data collected and/or owned by someone else?

Which categories of personal data will you be collecting?

Gender

Logging information records

Date of birth or age

Other: please specify in the text box

online behavioural tracking data

Data management

Describe where, how, and for how long the data will be stored. If applicable, describe separately for personal data, sensitive data, and anonymous data.

Quantitative data: De-identified anonymised data will be transferred to the EUR under the terms of the collaboration and data processing agreements set up among the collaborators (i.e., EUR/UvA, PlayTech and Holland Casino). Quantitative data and all related study materials such as the conceptual design of the full RG framework, the library of micro-interventions, and the POC study protocol, dataset in an aggregated format, data processing and statistical analysis scripts, will be shared open access via the Open Science Framework and will be stored and archived for 10 years within the EUR repository in accordance with the EUR policy for Research Data Management (EUR, approved in 2020 and effective on 1-1-2021).

Qualitative data: Transcripts of qualitative interviews will not be shared open access to protect participants' confidentiality. Qualitative data and all related study material will be stored and archived for 10 years in the EUR repository in accordance with the EUR policy for Research Data Management (EUR, approved in 2020 and effective on 1-1-2021).

Who will be able to look into the collected data?

Principle investigators: Marilisa Boffo & Harriet Galvin.

Quantitative and qualitative data will be collected and analysed by student assistants and/or master students under the supervision of the principal investigators.

Will participants be able to look into their own and/or anonymized group data?

No

Please explain why not.

Under GDPR, players may request to access their own data at any time. Participants can request to do so to the collaborating gambling operators who hold the primary responsibility for the management and storage of their customers' data. Only anonymized data will be shared to EUR hence it is not possible for the researchers to give access to individual raw data.

Do you share your dataset with someone else within the same institute or from a different institute during your research?

Yes

Who has access to or with whom do you share your dataset during your research?

Other researchers connected to institute in the EEA

Company based in the EEA

Company based outside the EEA

Recruitment and characteristics of participants

What is the intended number of participants?

200000

How will participants be recruited?

Quantitative study

Both operators are mandated by law to implement and evaluate RG measures. The inclusion procedure will notify all players (at the next player login) of an update to the player interface designed to improve customer experience and protection (i.e., a study brief). No explicit consent will be asked concerning receiving the POC framework (interface); however, all players are given a choice to opt out at any time and without reason from sharing their anonymized data for scientific research purposes by adjusting their privacy settings, in accordance with European data privacy regulation (GDPR, 2018).

Qualitative study

Participants will be recruited from the quantitative sample via purposive sampling. The quantitative sample will be divided into four groups based on the difference in gambling risk status between the start and end of the study period. From these four groups, subsamples will be randomly selected for potential participation, stratified by aggregated levels of engagement activity with the RG tools they received. Gender and preferred types of gambling (i.e., the type of gambling games a participant played most frequently and for the longest duration during the study period) will be taken into account to maximize the diversity and representativeness of the sample. Once each sub-sample of players is identified, respective lists of anonymized userIDs will be communicated to the operators who will then invite the corresponding players to an online form where they can express their interest in participating. A first batch of 10 participant email invites to the online form will be sent. If any participants decline the invitation, a second group of 10 participants will be selected based on the same criteria and invited to participate. Recruitment per subgroup will continue (in groups of 10) until the desired sample size is reached, upon which invited participants will be informed they cannot participate anymore. The email invite will redirect participants to an enrolment online form which will briefly explain the main goal of the interview and the terms of participation (i.e., participation is voluntary and can be stopped at any moment, no further contact attempts will be made when they decide not to participate).

Describe the participant population. If applicable, describe inclusion and exclusion criteria.

Participants in the POC study are gamblers with an active account on two gambling operators in NL and UK. Eligible players are automatically included in the study within the boundaries of regulatory

requirements in both the UK and NL (i.e., mandatory presence of RG tools for player protection). Players will be included as research participants when fulfilling the following criteria: 18+ and satisfying all legal requirements to engage in online gambling on the operator site and having a minimum of 15 active gambling days in the past 60-days (as required to accurately assess gambling risk), and consent to share their data for scientific research. No sample size analysis has been conducted due to the exploratory and preliminary nature of the POC study and the focus on the whole customer base of operators, composed of thousands of players. Should the implementation of the POC version not be possible on the whole customer base on one or both operators, a random sample of 30000 active accounts will be selected to receive the POC, stratified by gender and age groups. No personal or sensitive information is collected, and no exclusion criteria are imposed; hence, gender and ethnic groups will be naturally represented as part of the customer base population.

Will there be any kind of compensation for participating in this study?

Yes

Please describe the nature of the compensation and when it will be allocated.

Only participants recruited for the qualitative study will be compensated for their time. Compensation will be with a voucher (Amazon.uk and Bol.com) of a value of 10€ or 10£.

Informing your participants

Do you seek active, voluntary and informed consent from all participants (and/or their legal guardians) before they start the study?

No

Please explain why not.

Quantitative study: Gambling operators are mandated by law to implement and evaluate responsible gambling initiatives within the online gambling environment. As such, no explicit consent will be asked concerning receiving the POC RG framework since customers cannot refuse to receive such tools. However, all players are given the choice to opt-out at any time and without reason from sharing their anonymized data for scientific research purposes by adjusting their privacy settings in accordance with European data privacy regulation (GDPR, 2018).

Qualitative study: informed consent is actively collected before the interview takes place.

Will participants participate in the study after they (and/or parents/caretakers) are made aware of their right to withdraw at any time during or after the experiment (even when they receive compensation) and to have their data destroyed?

Yes

Is it possible that your study will have incidental findings?

No

Will any information be withheld from the participants before they start the study?

No

Will participants be fully debriefed after their participation has ended?

Yes

Risks or negative consequences

Could participants experience any negative consequences from participating in the study?

No

Could participating researcher(s) experience any negative consequences from the study?

No

Are participants in a relation of dependency or subordination to the researcher(s)?

No

Are there any ethical concerns related to the power relationship or conflicts of interest between the researchers and related others?

No

Does your research involve any of the following activities?

Not applicable

Closing details

Are there any other ethical issues relevant to the study that you are concerned of and that have not been discussed?

No

Uploads

Have you consulted a data steward about this project?

Yes

Do you have a Data Management Plan for this project?

Yes

If you have a Data Management Plan, please upload it here.

Please upload the following documents when applicable

Information letter(s)

Informed consent form(s)

Debriefing information

Topic lists, survey questionnaires etc.

Permission for use of existing datasets

Information Brief & Informed Consent – Quantitative study

*Since the gambling operators are mandated by national regulations to protect their customers by enacting a range of measures, including monitoring players' gambling activity, players cannot choose to **not** receive RG measures. However, a player status as a research participant is defined by players' choice of sharing their data for scientific research purposes (opt – out options in privacy settings). Players are free to withdraw from sharing their data at any time with no consequences and without depriving them of access to the POC RG tools. The project is carried out online on the operators' platform, who are responsible for players' data use and privacy conditions. Hence, there is no transfer of written documents between participant and the researchers. When the RG framework is deployed on the operator's site, the communication below is presented via a pop-up message at the next-player-login.*

Welcome back to [operator site],
new features have been added to your player interface and we have updated our Privacy Policy [hyperlink to PP page] to bring you a more personalised player environment. Some of your data will now be shared with our research partners to help tailor your gaming experience in support of smarter and safer gambling practices.
You can always review your data privacy setting by clicking below.

By continuing to play, you agree to these changes.
[icon – link to close pop-up and continue play] CONTINUE
[icon – link to privacy settings] REVIEW PRIVACY SETTINGS

Players can access their privacy settings at any time where information is provided on the terms of use and sharing of their data. By deselecting (ie, opt out) an icon embedded within the privacy settings of each operator site, players (i.e., participants) revoke consent for their data to be shared for scientific research purposes.

Here at [operator site] we're committed to helping you use our platform to its full potential and we want to make sure that everyone gets the most out of their playing experience. [Operator] has teamed up with an academic research team (Erasmus University Rotterdam and University of Amsterdam) to help us evaluate how best to support your responsible gambling choices. By agreeing to share your data you not only help us improve the safety of your gambling experience but also help provide safer practices to our whole community.

All internet users have a right to decide what is going to happen with their data. Preserving your privacy is our top priority; all your data when shared will be fully anonymised, removing all identifying particulars or details that are personal to you.

If you have any questions on our data sharing policy or would like more information regarding our research endeavours to support responsible play, please contact our customer service [hyperlink to operatory customer service].

NB: All information here will be translated to Dutch for use on Holland Casino's site.

Information Brief and Informed Consent - Qualitative study

A list of pre-selected userIDs will be communicated to the gambling operators, who will invite the corresponding players to an online form where they can express their interest in participating in the qualitative study and receive a registration link to the informed consent form and interview planning. Informed consent will ask asked to indicate their agreement with all the terms for participation, if they do not agree with one or more of the terms, they cannot take part in the qualitative interview. The below information will be presented to the participant via the link received from the gambling operator.

Welcome to the Safe Bet: Player Satisfaction and User Experience Investigation!

Thank you for playing on [operator site] and being a valued member of our player community. Here at [operator site] we're committed to helping you use our platform to its full potential so that everyone can get the most out of their playing experience.

We are very curious to know how you as a player interact with our site and your experiences with our player protection features. With your feedback we hope to improve and further develop our player experience. Perhaps you found certain elements work very well, or less well, and you see opportunities to improve the gambler's experience.

We have selected you from a large group of players, because we think you are in a unique position to provide us with valuable insights. To get the best information and ensure your voice is truly heard we are inviting you to a video call interview!

Please read the following information carefully, and if you would like to participate, please follow the link to our consent form and indicate a time that suits you best.

The key interview details:

- When: a time that suits you!
- Where: online – Zoom or MS Teams – call lasting approx. 30 mins.
- Who: [Operator] has teamed up with a research group from the Erasmus University Rotterdam and University of Amsterdam, who will conduct the interviews
- What ('s in it for me): you will receive a [Amazon.uk or Bol.com] voucher worth [10£ or 10€] for participating in the interview.

NB: Participation in this interview is completely voluntary and confidential. Voluntary, because you are free to stop participating in the interview at any time without giving any reason (even after completion of the interview). Confidential, as all interview data is stored, processed, and reported anonymously and securely. It is important to note that audio recordings will be made of the interviews. These recordings will be transcribed with all your personal information, such as names and locations, removed to protect your privacy. The interviews will then be anonymously analysed together, and the original audio recordings will be destroyed.

We would greatly appreciate your time and input. Please use the button below to let us know you want to help:

[button "yes, I would like to give my feedback and participate in an interview" (next page – consent form)].

If, for any reason, you would rather not take part, you can let us know using the button below. We will assume that you prefer not to participate in this interview if we do not receive a response within 14 days. We will not contact you again in this case. There is no need for you to take any action. We would like to thank you for your time and attention and will not contact you again.

[button "No, I would rather not take part in the interview" (next page – online form closure)].

Consent form

[if they clicked on the "yes" button in the briefing message].

As the interview is conducted over the video call, there is no transfer of documents to the participants. When clicking on the " yes, I would like to give my feedback and participate in an interview " button in the briefing message, participants enter next page screen with the following information. On this page, participants must indicate separately whether they agree with all the conditions. If they do not agree with one or more of the conditions, they cannot take part in the interview.

How nice of you to help us and help improve [operator site] for everyone! Your valuable feedback is much appreciated and will help improving yours and other players' experience and protection.

First of all, we would like to draw your attention to the following.

In order to use your feedback it is necessary that you give us permission to do so. Please note! If you do not tick one or more of the statements below, you will not be able to participate in the interview.

- ☐ I confirm that I have read and understand the information about the interview in the information page.
- ☐ I know that my participation is completely voluntary and that I can withdraw my consent at any time without having to give a reason.
- ☐ I understand that interview data may be used for scientific research purposes. I consent to this, assuming my anonymity is guaranteed.
- ☐ I give permission for audio recordings to be made, assuming they will be deleted after they have been anonymised into (digital) written text
- ☐ I understand that I can, now or in the future, address questions to the customer services team of [operator site] at [operator customer service email].
- ☐ I understand that for any complaints about this study I can contact the customer services team of [operator site] at [operator customer service email].

To ensure the naturalistic design of the study is upheld and that we comply with the operators' terms of service and privacy regulation (under GDPR) all direct contact with participants will be conducted via the gambling operator.

Please click "Next" to submit your responses and be taken to video call time-slots!

Participants will then be directed to the interview planning schedule (Doodle.com) and indicate preferred times for the interview to be conducted.

NB: All information here will be translated to Dutch for use on Holland Casino's site.

Semi Structured Interviews - Qualitative study

The interviews will be conducted by the PhD candidate with the support of one Dutch native-speaker student assistant and will take approximately 30 minutes to complete.

Responsible Gambling (RG); Responsible Gambling Tool (RGT)

Interviews will follow a semi-structured script on the following topics: type of RGT Modality, RGT preferences, RGT quality and RGT delivery.

Theme	Sub-Theme	Probing question example:	Sub-question example:
RGT Modality	Received RGTs	<i>"Have you seen any messages or other functions on the website concerning safe gambling practices (e.g., information about problems, setting limits) from [operator site]?"</i>	<i>"What is your day to day experience with safe gambling practices on [operator site]?"</i>
	RGT interactions	<i>"How would you describe your level of interaction with safe gambling practices on [operator site]?"</i>	<i>"Can you describe how you make use of any tools on [operator site] for your safe gambling during an average gambling session or period?"</i>
			<i>"What tools or other elements could be added to communicate safe gambling practices through [operator site]?"</i>
RGT Preferences	Most preferred	<i>"What do you like most about the tools to support safe gambling practices offered by [operator site]?"</i>	<i>"What is the main benefit you feel you receive from the tools offered by [operator site] to support safe gambling practices?"</i>
			<i>"What tools are most important to you in supporting your play experience?"</i>
	Least preferred	<i>"What do you like least about the tools to support safe gambling practices offered by [operator site]?"</i>	<i>"What annoys you about the tools you received – any in particular?"</i>
RGT Quality	Utility	<i>"What do you consider to be useful or interesting about the safe gambling (or RG) resources (and tools) offered by [operator site]?"</i>	<i>"In what ways did the RG tools help you or support your play experience?"</i>

			<i>"How useful do you think the safe gambling tools offered by [operator site] are at supporting your play experience?"</i>
			<i>"What tools could be added to support your play experience?"</i>
			<i>"How likely are you to continue making use of the safe gambling tools offered by [operator site]?"</i>
	Appropriateness	<i>"Did you think the content of the safe gambling messaging was appropriate?"</i>	<i>"How appropriate do you think the language used by [operator site] concerning safe gambling was?"</i>
			<i>"What messages would you design to encourage people to engage with safe gambling practices?"</i>
	Relevance	<i>"How relevant were tools to support safe gambling tools offered by [operator site] to supporting your play experience?"</i>	<i>"Are there any changes you would make so tools for safe gambling practices are more relevant to you?"</i>
	Clarity	<i>"How clear and understandable did you find the safe gambling tools offered by [operator site]?"</i>	<i>"What could improve the safe gambling content clarity offered [operator site]?"</i>
RGT Delivery	Accessibility	<i>"How accessible did you find the safe gambling tools offered by [operator site]?"</i>	<i>"Were the RGTs accessible to you when you wanted them to be?"</i>
			<i>"Were the RGTs accessible to you where you wanted them to be?"</i>
			<i>"What tools or web features could be added to organize the safe gambling content of [operator site] better?"</i>
	Interference	<i>"Were there occasions where you experienced friction or annoyance from the safe gambling tools offered by [operator site]?"</i>	<i>"Were there any occasions when you felt the safe gambling tools detracted from your play experience?"</i>
			<i>"Were safe gambling messages delivered at appropriate times?"</i>
	Taxation	<i>"How did you feel about the amount of safe gambling content / messages /tools you received in comparison to before the user interface was updated by [operator site]?"</i>	<i>"What would make you more likely to follow through on a safe gambling action suggested by the website?"</i>

User Satisfaction Intercept Surveys – Quantitative Study

User satisfaction with Responsible Gambling Tools (RGTs) will be assessed via short intercept user satisfaction surveys released live on the operator's website during the quantitative study period. These brief surveys will assess a given RGT deployed to the player based on the following dimensions when applicable: satisfaction, intrusiveness, usability, and utility perception.

They will include max 1 question per dimension rated on a five-point Likert scale [1-5; strongly agree to strongly disagree], with an additional response option indicating non-use or viewing the given RGT [single item selection tick box]. Surveys will be distributed over the study period after implementing a RGT using a quasi-random deployment approach. Questions will be specific to the RGT received by the player and aligned to the function of the RGT (i.e., call-to-action, educational content to raise awareness or personalised feedback). Examples are as follows:

Call-to-action RGT (e.g., prompt for a gambler to set a new/change their deposit limit.)
<i>The deposit limit prompt interrupted my gambling session. [Intrusiveness]</i>
<i>The deposit limit prompt made it easy for me to change my limit. [Usability]</i>
<i>The deposit limit prompt was useful in setting a new limit. [Utility]</i>
<i>I did not see or use the deposit limit prompt.</i>
Educational content RGT (e.g., notification with financial advice on how and the benefit of setting an appropriate deposit limit.)
<i>I was satisfied with the deposit limit advice I received. [Satisfaction]</i>
<i>The deposit limit advice helped me set an appropriate limit. [Utility]</i>
<i>I did not see the deposit limit notification.</i>
Personalised feedback RGT (e.g., notification with personalised feedback on their depositing activity in the prior X-period.)
<i>The deposit activity notification gave me valuable insights into my own deposit activity. [Utility]</i>
<i>The deposit activity notification interrupted my gambling session. [Intrusiveness]</i>
<i>I did not see the deposit activity notification.</i>

Permission for Use of Existing Data

We will obtain primary data directly from individuals. We do **not** obtain publicly available data or obtain existing data. However, the data is collected by a collaborative effort between the Erasmus University Rotterdam and two industry partners; Playtech and Holland Casino.

A Collaboration Agreement between all parties has been made (under the supervision and advice of EUR legal counsel Renée Hanegraaf) along with a Data Sharing Agreement between all parties (under the supervision and advice of EUR privacy officer Bo Schijven).
